Answers

Test Yourself 1.1

- $0 V = kg m^2 s^{-3} A^{-1}$
- 2 [G] = $kg^{-1}m^3s^{-2}$
- **3** (a) $\varepsilon_0 = \frac{1}{4\pi} \frac{Q_1 Q_2}{Fr^2}$, so $[\varepsilon_0] = \frac{[Q_1][Q_2]}{[F][r^2]} = \frac{C \times C}{N \times m^2} = C^2 N^{-1} m^{-2}$
 - (b) Using C = A s and N = kg m s⁻², $[\varepsilon_0] = kg^{-1} m^{-3} s^4 A^2$
- **4** (a) [h] = J s
 - (b) $[h] = \text{kg } \text{m}^2 \text{s}^{-1}$
- **5** $[\mu_0] = H m^{-1} = kg m s^{-2} A^{-2}$, so $H = kg m^2 s^{-2} A^{-2}$
- 6 $F = [C] = kg^{-1} m^{-2} s^4 A^2$
- 2.5 MΩ [= 2.5 × 10⁶ Ω]
- 8 $\left[\frac{1}{\varepsilon_0\mu_0}\right] = \frac{1}{\mathrm{kg}^{-1}\,\mathrm{m}^{-3}\,\mathrm{s}^4\,\mathrm{A}^2 \times \mathrm{kg}\,\mathrm{m}\,\mathrm{s}^{-2}\,\mathrm{A}^2} = \mathrm{m}^2\,\mathrm{s}^{-2} = [\mathrm{c}^2]$ QED
- 9 (a) $[\sigma] = W m^{-2} K^{-4}$
 - (b) $[\sigma] = M T^{-3} \Theta^{-4}$
 - Note: L cancels out so $[\sigma]$ does not depend on L
- $\mathbf{10} \quad [W] = \mathbf{L} \, \Theta$
- **1** $\Omega = [R] = \text{kg m}^2 \text{ s}^{-3} \text{ A}^{-2}$
- (a) $[c] = J kg^{-1} K^{-1}$
 - (b) $[c] = m^2 s^{-2} K^{-1}$
- **1** N s = (kg m s⁻²) × s = kg m s⁻¹
- Starting from the rhs and working in dimensions: $[p\Delta V] = \left[\frac{F}{A}\right] \times [\Delta V] = \frac{M L T^{-2}}{L^2} \times L^3 = M L^2 T^{-2} = [W] \quad QED$
- 10 Working in units
 - $[p^2c^2] = N^2 s^2 \times m^2 s^{-2} = N^2 m^2$
 - $[m^2c^4] = kg^2 m^4 s^{-4} = (kg m s^{-2})^2 m^2 = N^2 m^2$
 - \therefore The right-hand side is homogeneous.
 - $[E^2] = J^2 = (N m)^2 = N^2 m^2$

So the two sides have the same units, i.e the equation is homogeneous.

Working in dimensions:

Dimensions of the right side = $[nAve] = L^{-3} L^2 (L T^{-1}) (I T) = I$ = dimensions of the left side QED

- 0 6.4 μm s⁻¹
- ^(B) If $E_{k \max}$ is expressed in J then the units of both terms on the right must be J, i.e. $[\phi] = J$.
 - If $E_{k \max}$ is expressed in eV then $[\phi] = eV$.
- **(**) Working in dimensions: $[p] = \left[\frac{F}{A}\right] = M L T^{-2} L^{-2} = M L^{-1} T^{-2}$ $\left[\frac{1}{3}\rho c^2\right] = M L^{-3} (L T^{-1})^2 = M L^{-1} T^{-2}$. The two sides have the

same dimensions, hence the equation is homogeneous.

Working in units: $\left[\frac{h}{\lambda}\right] = \frac{Js}{m} = \frac{Nms}{m} = Ns = [p]$, so the equation is homogeneous.

2 Working in dimensions: $[p] = M L^{-1} T^{-2}; [\rho] = M L^{-3};$

$$\left[\sqrt{\frac{\gamma p}{\rho}}\right] = \sqrt{L^2 T^{-2}} = L T^{-1}$$

 $[c] = L T^{-1}$, so the two sides have the same dimensions, i.e, the equation is homogeneous.

- Working in units: From Q2, $[G] = \text{kg}^{-1} \text{ m}^3 \text{ s}^{-2}$. $\therefore \left[-\frac{GM_1M_2}{R} \right] = \frac{\text{kg}^{-1} \text{ m}^3 \text{ s}^{-2} \text{ kg} \text{ kg}}{\text{m}} = \text{kg} \text{ m}^2 \text{ s}^{-2} = [E]$ The two sides have the same dimensions, i.e. the equ
 - The two sides have the same dimensions, i.e. the equation is homogeneous.
- (2) $a = \frac{1}{2}$; $b = -\frac{1}{2}$, i.e. $v = c\sqrt{\frac{K}{\rho}}$. Compare this with Q21.

2
$$a = b = -\frac{1}{2}$$
; $c = \frac{3}{2}$, i.e. $T = k \sqrt{\frac{r^3}{GM}}$. Compare this with Kepler's 3rd law.

(2) $x = z = \frac{1}{2}$; $y = -\frac{1}{2}$, i.e. $c = k \sqrt{\frac{Tl}{m}}$. In fact it is usually written $c = \sqrt{\frac{T}{\mu}}$, where μ is the mass per unit length of the wire. The dimensionless constant k = 1.

5

Test Yourself 6.2

The solutions given are the least squares fit solutions. For graphs drawn freehand, slightly different, but equally acceptable, answers will be obtained.

- **0** Gradient $-1.0 [\Omega]$; intercept 6.12 [V]. So emf = 6.12 V; internal resistance = 1.0Ω
- **2** Gradient 0.21 [m s⁻²], intercept 3.63 [m s⁻¹]. So initial velocity = 3.63 m s^{-1} ; acceleration = 0.21 m s^{-2} .
- Gradient 0.228 [N cm⁻¹]; intercept −1.13 [N]. So spring constant = 0.228 N cm⁻¹, unloaded length = 4.9 cm.
- Gradient 0.0036 [atm °C⁻¹], intercept 0.945 [atm];
 So p₀ = 0.945 atm and absolute zero (from data) = -263 °C.
- **6** Gradient -0.0469 [V mA⁻¹]; intercept 10.5 [V]; Emf = 10.5 V; internal resistance = 47 Ω .
- 6 The graph of √s against *t* is a straight line with a gradient 1.14 and an intercept of 0.073 on the √s axis [LSF]. This is close enough to a zero intercept to verify the relationship. The acceleration is 2× gradient² = 2.6 m s⁻².
- **O** Graph v^2 against *s*. It is straight with gradient 0.562 and intercept 404. The acceleration $a = \frac{1}{2} \times \text{gradient} = 0.28 \text{ m s}^{-2}$. The intercept is u^2 so $u = 20 \text{ m s}^{-1}$.
- **3** Plot *f* against 1/l on a restricted axis [e.g. 240 520 Hz and 2.4 5.0 m⁻¹]. Other possibilities are 1/f against *l* or the axis may be the other way around. Using f v 1/l the intercept on the *f* axis is 1.2 Hz [LSF] which is close to zero and hence consistent with the relationship. The gradient is c/2 = 104 [m s⁻¹], so c = 208 m s⁻¹.
- As in 6.5.2 the graph should be *l* against 1/*f*. The gradient is c/4 and the intercept -ε. The graph is straight with gradient 8580 [cm s⁻¹] and intercept -1.3 [cm] giving the speed of sound as 34320 cm s⁻¹ [342 m s⁻¹] and end correction 1.3 cm.
- A graph of T^2 against *l* should be straight with a gradient of $4\pi^2/g$ and intercept $4\pi^2 \varepsilon /g$. The graph has a gradient of 4.11 [s² m⁻¹] and intercept 0.082 [s²]. This gives g = 9.6 m s⁻² and $\varepsilon = 2$ cm.
- **1** A graph of *d* against $1/\sqrt{R}$ should be straight with gradient \sqrt{k} and intercept $-\varepsilon$. The graph has a gradient of 236 and an intercept on the *d* axis of -1.8. This gives a value for *k* as 56 000 cpm cm², and ε as 1.8 cm.
- A graph of T^2 against l^2 should be straight with gradient $\frac{2m}{k}$ and intercept $\frac{I}{k}$ on the T^2 axis. The graph is straight with gradient 5600 [s² m⁻²] and intercept 28.5 [s²]. With m = 0.1 kg this gives a value of k of 3.6×10^{-5} kg m² s⁻² [or, N m rad⁻¹] and $I = 1.0 \times 10^{-3}$ kg m².
- **B** A graph of T^2y against y^2 should be a straight line with gradient $\frac{4\pi^2}{g}$ and intercept $\frac{4\pi^2k^2}{g}$ on the T^2y axis. The graph is a straight line of gradient 4.00 [s² m⁻¹] and intercept 0.76 [s² m] on the T^2y axis. This gives g = 9.87 kg m⁻² [or N kg⁻¹] and k = 0.43 m.

- A graph of $\frac{1}{V}$ against $\frac{1}{R}$ should be straight with gradient $\frac{r}{E}$ and intercept $\frac{1}{E}$ on the $\frac{1}{V}$ axis. The graph is straight with a gradient of 0.219 [Ω V⁻¹] and intercept 0.103 [V⁻¹]. This gives a values of *E* as 9.7 V and *r* as 2.1 Ω.
- **6** A graph of $\frac{1}{v}$ against $\frac{1}{u}$ [or vice versa] should be a straight line of gradient -1 with an intercept on either axis of $\frac{1}{f}$. The graph has a gradient of -1.00 as predicted and an intercept of 0.0679 on the $\frac{1}{v}$ axis, giving a value for *f* of 14.7 cm.
- **(b** The graph of $\sin \theta_2$ against $\sin \theta_1$ is straight with a gradient of 0.803 and an intercept of 0.0014 on the $\sin \theta_2$ axis, which is consistent with passing through the origin. Hence $\sin \theta_1 \propto \sin \theta_1$. The speed of light in glass is 0.803 × the speed in water.

Speed of light in water = $\frac{3.00}{1.33} \times 10^8 \text{ m s}^{-1}$. This gives the speed of light in glass as $1.81 \times 10^8 \text{ m s}^{-1}$.

Data Exercise 6.1

 E_p minimum = -0.245, at a separation of 1.12-1.13

Data Exercise 6.2

The LSF graph has a gradient of 1.31 $[m s^{-2}]$ and intercept of 0.006 [m] on the *s* axis. This is consistent with a constant acceleration of 2.6 m s⁻² and initial value of *s* = 0.

- (a) $v_{\text{max}} = 20\pi = 62.8 \text{ cm s}^{-1}$; $a_{\text{max}} = 40\pi^2 = 396 \text{ cm s}^{-2}$
 - (b) for 6(a): v_{max} at -0.25 s and 0.75 s; a_{max} at -0.5 s and 0.5 s for 6(b): v_{max} at 0.25 s and -0.75 s; a_{max} at -1 s, 0 and 1 s for 6(c): v_{max} at -1 s, 0 and 1 s; a_{max} at -0.25 s and 0.75 s for 6(d): v_{max} at -0.1 s and 0.9 s; a_{max} at -0.35 s and 0.65 s

a
$$\omega = \sqrt{\frac{k}{m}} = \sqrt{50} = 7.07 \text{ s}^{-1}; f = \frac{\omega}{2\pi} = 1.125 \text{ Hz}; T = \frac{1}{f} = 0.889 \text{ s};$$

 $A = 12 \text{ cm}$

- $x = 12 \cos 7.07t; v = -85 \sin 7.07t; a = -600 \cos 7.07t$ [in cm; again there are several ways of writing these, e.g. $v = 85 \cos(7.071t + \frac{\pi}{2})$]
- **1** $x = 2.82 \text{ cm}; v = 82.5 \text{ cm s}^{-1}; a = -141 \text{ cm s}^{-2}.$
- **1** 0.556 s, 0.778 s, 1.444 s and 1.667 s
- B K.E = $\frac{1}{2}mv^2$ = $\frac{1}{2} \times 0.5 \times (0.849 \sin 7.071t)^2$ = 0.176 J P.E. = $\frac{1}{2}kx^2$: Extension = $\frac{mg}{k}$ − 0.0187 = 0.178 m \therefore PE = 0.396 J
- (a) Max velocity = $A\omega = 2.0 \times 10 = 20 \text{ m s}^{-1}$. This occurs at t = 0.

 \therefore K.E (0) = $\frac{1}{2} \times 2 \times 20^2$ = 400 J. This is the maximum K.E.

- **(a)** −0.192 s; −0.058 s; 0.008 s; 0.142 s.
 - (b) -0.196 s; -0.154 s; 0.004 s; 0.046 s
- (a) $I = 0.12 \cos 200\pi t$
 - (b) (i) V = 3.71 V, (ii) I = 0.037 A, (iii) P = 0.138 W

(c) (i)
$$V_{\rm rms} = 8.49$$
 V, (ii) $I_{\rm rms} = 0.0849$ A, (iii) $\langle P \rangle = 0.720$ W.

(a) (i)
$$X_c = \frac{1}{\omega C} = 159 \,\Omega$$
, (ii) $I_0 = \frac{V_0}{X_c} = 0.075 \,\mathrm{A}$

(b)
$$I = 0.075 \cos \left(200\pi t + \frac{\pi}{2} \right)$$

(c) $I = -0.071 \,\text{A}$

- (a) $I = 0.191 \cos\left(200\pi t \frac{\pi}{2}\right)$
 - (b) I = 0.182 A

- (a) (i) $Z = \sqrt{100^2 + 159^2} = 188 \Omega$,
 - (ii) $I_0 = 0.064$ A,
 - (iii) $V_{\rm R} = 6.4$ V; $V_{\rm C} = 10.2$ V
 - (b) $V = \sqrt{10.2^2 + 6.4^2} = 12 \text{ V}$

$$\omega = 200 \pi \text{ s}^{-1}$$

 $V_{\text{R}} = 6.4 \text{ V}$
 $V_{\text{C}} = 10.2 \text{ V}$
 $I = 0.064 \text{ A}$

- (c) $\theta = \tan^{-1}\left(\frac{10.2}{6.4}\right) = 1.01 \text{ rad}$ (a) X is a resistor because V is in pha
- (a) X is a resistor because V is in phase with I; Y is a capacitor because I leads V by 90°.
 - (b) $R = \frac{V_{\rm R}}{I} = \frac{12}{2 \times 10^{-3}} = 6 \,\rm k\Omega; \frac{1}{\omega C} = \frac{V_{\rm C}}{I}$ $\therefore C = \frac{I}{\omega V_{\rm C}} = \frac{2 \times 10^{-3}}{500 \times 6} = 0.67 \,\mu\rm{F}/670 \,\rm{nF}$ (c) Applied voltage = $\sqrt{12^2 + 6^2} = 13.4 \,\rm{V};$

angle = 0.464 rad (= 26.6°)

(a) V_x is unchanged at 12 V because resistance is constant. V_y is halved to 3 V because capacitor reactance is inversely proportional to frequency.

(b)
$$V = 12.4 \text{ V}; \phi = 0.245 \text{ rad } (14.0^{\circ})$$

Method: $X_{\text{C}} = \frac{1}{250 \times 0.67 \times 10^{-6}} = 6000 \Omega$
 $Z = \sqrt{R^2 + X^2} = \sqrt{6^2 + 6^2} = 8.49 \text{ k}\Omega$

$$\therefore I = 1.58 \,\mathrm{mA}$$

6

:.
$$V_{\rm R} = 9.48 \text{ V}; V_{\rm C} = 9.48 \text{ V}; V = 13.4 \text{ V}$$

(b)
$$V = \sqrt{47^2 + (120 - 80)^2} = 61.7 \text{ V}$$

- (c) $\langle P \rangle = l^2 R \text{ [rms current]} = 0.1^2 \times 470 = 4.7 \text{ W}$ [or $V_{\text{R}} l = 47 \times 0.1 = 4.7 \text{ W}$]
- We thod: $X_{\rm L} = \omega L = 2\pi \times 100 \times 2.4 = 1510 \Omega$ $X_{\rm C} = \frac{1}{\omega C} = \frac{1}{2\pi \times 100 \times 2.5 \times 10^{-6}} = 637 \Omega.$

$$Z = \sqrt{R^2 + (X_{\rm L} - X_{\rm C})^2} = \sqrt{470^2 + 873^2} = 991 \,\Omega$$

$$\therefore I = \frac{V}{Z} = \frac{40}{991} = 0.040$$

(a) $\omega = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{2.4 \times 2.5 \times 10^{-6}}} = 408 \,\mathrm{s}^{-1}.$ $\therefore f = \frac{\omega}{2\pi} = 65.0 \,\mathrm{Hz}$

(b) The reactances of the inductor and capacitor are equal and opposite, so Z = R.

$$\therefore I = \frac{V}{R} = \frac{50}{470} = 0.106 \text{ A.}$$

(c) $V_{\rm R} = 50 \text{ V}; V_{\rm L} = I\omega L = 0.106 \times 408 \times 2.4 = 104 \text{ V};$ $V_{\rm C} = V_{\rm L} = 104 \text{ V}$ [Alternatively calculate $V_{\rm C}$ using $V_{\rm C} = \frac{I}{\omega C}$]

(d) Only the resistor dissipates power.

so
$$\langle P \rangle = I_{\rm rms}^2 R = 0.106^2 \times 470 = 5.3 \,\rm W$$

Test Yourself 9.1

- **1 E** = 3 kV m^{-1} downwards [or 3 kN C^{-1}]

 - : Electrical PE 5 cm apart = 5.08×10^{-5} J
 - \therefore Loss in electrical PE = 2.54 × 10⁻⁵ J

Gain in height between the two positions = 0.48 cm [needs calculating]

: Gain in gravitational potential energy = $mg\Delta h$ = 9.4 × 10⁻⁶ J

:. Loss in PE =
$$2.54 \times 10^{-5} - 9.4 \times 10^{-6}$$
 J = 1.60×10^{-5} J

Using KE = $\frac{1}{2}mv^2$ we get v = 0.4 m s⁻¹.

- (a) $121\,000\,V\,m^{-1}$ (b) 0
- **2** (a) 5.95×10^{24} kg (b) 9.78 N kg⁻¹ [Both correct to 2 s.f.]

(2) Total mass within outer core boundary = 1.98×10^{24} kg This gives g = 10.8 N kg⁻¹

The uniform density value would be $\frac{3500}{6370} \times 9.8 = 5.4 \text{ N kg}^{-1}$, i.e. true value ~ 2× uniform density value.

- **2** (a) acceleration = $8.8 \times 10^{12} \,\mathrm{m \, s^{-2}}$
 - (b) radius of circle = 1.14 mm
 - (c) 14 MHz

Mathematics for Physics

Answers

The force due to the magnetic field provides the centripetal force.

 $\therefore \frac{mv^2}{r} = Bqv. \therefore \omega = \frac{v}{r} = \frac{Bq}{v}.$

 $\therefore f = \frac{Bq}{2\pi m}$, which is independent of the speed.

For a proton with $m = 1.67 \times 10^{-27}$ kg, f = 460 Hz.

29 Peak current = $I_0 \times \sqrt{2}$ = 28.3 A.

 $F_{\text{max}} = BI\ell \cos \theta = 5 \times 10^{-5} \times 28.3 \cos 60^{\circ} = 0.7 \text{ mN}; f = 50 \text{ Hz}$ $\therefore \omega = 100\pi$

- \therefore F / mN = 0.7 cos (100 $\pi t + \varepsilon$)
- 3 Algebraically, induced emf $\mathcal{E}_{in} = \frac{\Delta(N\Phi)}{t} = B\ell v$
 - $\therefore I = \frac{B\ell v}{R}.$ So the motor force, $BI\ell = \frac{B^2\ell^2 v}{R}.$

:. The work done per second, $P = \frac{B^2 \ell^2 v^2}{R}$ The electrical power $P = I^2 R = \left(\frac{B\ell v}{R}\right)^2 R = \frac{B^2 \ell^2 v^2}{R}$, which is the same.

Numerically in Example G, both powers are 0.05 W.

Data Exercise 10.1

 $x_1 = 2.0; y_1 = 14.0$

X2	<i>Y</i> ₂	Δx	Δy	$\frac{\Delta y}{\Delta x}$
3.0	29.00	1.0	15	15
2.5	20.75	0.5	6.75	13.5
2.1	15.23	0.1	1.23	12.3
2.05	14.6075	0.05	0.6075	12.15
2.01	14.1203	0.01	0.1203	12.03
2.005	14.06008	0.005	0.060075	12.015
2.001	14.012	0.001	0.012003	12.003

As $\Delta x \to 0$, $\frac{\Delta y}{\Delta x}$ appears to tend to 12. This is confirmed by the fact that if $\Delta x = -0.001$, $\frac{\Delta y}{\Delta x} = 11.997$.

Data Exercise 10.3

No. of	Lower	Upper
